**Acromegaly**

A disorder that results from excess growth hormone (GH).

### Causes

The most common cause of acromegaly is a somatotroph (GH-secreting) adenoma of the anterior pituitary.

### Prevalence

70,000 Patients in US and EU¹

### Symptoms and Complications²

- Increased risk of tumours
- Loss of vision
- Excessive tissue growth (skin, connective tissues, cartilage, bone, viscera, and epithelial tissues)
- Cardiovascular disease
- Hypertension
- Fatigue and weakness
- Metabolic disorders

### Treatments³

Only 45-70% of cases benefit from current therapies. Available treatments are expensive and invasive.

### Advantages

Our approach has a lower cost of therapy, reduced patient burden, more convenient administration and a superior safety profile.
